Abstract

The new species Dregea taynguyenensis from Vietnam is described, illustrated and compared with the other Dregea species occurring in Vietnam and neighbouring countries D. cuneifolia, D. sinensis, D. volubilis and D. yunnanensis. Dregea taynguyenensis differs from these species by the leaf blade secondary veins number, calyx lobes shape, and corolla lobes size.

Key words: Asclepiadaceae, Marsdeniaceae, Southeast Asia, Wattakaka

Introduction

The genus Dregea Meyer (1837: 199) comprises approximately 12 species (Li et al. 1995) mainly distributed in southern Asia and tropical Africa. Species of Dregea are woody vines with watery or milky sap, bearing pseudo-umbelliform, axillary pendulous inflorescences. Its flowers are characterized by broadly campanulate to almost rotate, deeply lobed corollas, corolla lobes contorted in bud, and a fleshy staminal corona with outer lobe processes obtuse or rectangular and inner lobe processes acute.

Dregea has often been treated as a synonym under Wattakaka Hasskarl (1857: 99), e.g. in Flora of Bhutan (Watson 1999: 723), Flora of India (Jagtap & Singh 1999: 172), and in the latest Apocynaceae classification (Endress et al. 2014: 187); however, Dregea predates Wattakaka by 20 years. Schlechter (1914) treated Dregea as a synonym of Marsdenia Brown (1810: 460), which was followed by Forster (1995). The systematic position of Dregea is indeed close to Marsdenia (Surveswaran et al. 2014) but whether the two genera should be considered synonymous could not be ascertained in the phylogeny obtained by Surveswaran et al. (2014), due to the insufficient sampling of the two genera and poor resolution of the Marsdenia clade.

In Vietnam, two species of Dregea have been recorded so far (Costantin 1912, Ho 2000, Li et al. 1995, Tran 2005, Tran 2010). Among neighbouring countries, in China occur four species (Li et al. 1995), D. cuneifolia Tsiang & Li (1974: 127), D. sinensis Hemsley in Forbes & Hemsley (1889: 115), D. volubilis Benth ex J.D. Hooker in J.D. Hooker (1883: 46) and D. yunnanensis (Tsiang) Tsiang & Li (1974: 129), while only D. volubilis is recorded for Laos (Newman et al. 2007) and Cambodia (Costantin 1912).

Fieldwork in Tay Nguyen area, Kon Ka Kinh National Park in 2011 by the first author led to the discovery of an unidentified Dregea species. Upon comparison with herbarium specimens at HN, HNU, HNPM, IBK, K, KUN, KYO, P, SING, TI, TO, TUT, and VNM, as well as images of type specimens available at Jstor Plants (https://plants.jstor.org/), it was identified as a new species, which is described and illustrated below.

Taxonomy

Dregea taynguyenensis T.B. Tran & Rodda, spec. nov. (Figs. 1–3)

Dregea taynguyenensis is most similar to D. cuneifolia due to the elliptic-oblong leaf blades, cuneate at base and acuminate at apex. The
former is distinguished from the latter by having 7–10 secondary veins each side of midrib (vs. 5–6 in \(D.\) \textit{cuneifolia}), calyx lobes lanceolate to linear (vs. ovate) and corolla lobes 10.2–12.6 \(\times\) 5.3–6.4 mm (vs. c. 4 \(\times\) 4 mm).

**Type:**—Vietnam. Tay Nguyen: Gia Lai province, Kon Ka Kinh National Park, 14.26°00.1′N 108.21°45.7′E, 1194 m, 9 June 2011, \(T.B.\) Tran, \(V.H.\) Do & \(H.Q.\) Bui Bach0906201101 (holotype HN [HN0000070158]; isotype HN [HN0000070159]).

Woody vine; main stem to 10 m long or more. \textit{Young stem} pubescent, becoming glabrescent with age; \textit{internodes} 7.5–10 cm long. \textit{Petioles} 1.2–1.8 cm long, 2.5–3 mm in diam., pubescent; \textit{leaf blades} elliptic or oblong, 10.8–12 \(\times\) 3.6–3.8 cm, cuneate at base, acuminate at apex, glabrous above, pubescent below; secondary veins 7–10 on each side of midrib, tertiary venation reticulate, prominent below. \textit{Inflorescences} axillary, pseudo-umbelliform, convex, 18–40-flowered; \textit{peduncle} 4.1–7 cm long, pubescent. \textit{Flower bud} conical, 8.2–8.3 \(\times\) 9–10 mm just before anthesis, greenish white. \textit{Pedicels} 2.7–3 cm long, 0.8–1.5 mm thick, pubescent. \textit{Flowers} 27–29 mm in diam. \textit{Calyx lobes} slightly overlapping to the right or to the left at base, lanceolate to linear, 2.4–5 \(\times\) 0.7–1.5 mm, green flushed brown outside, green inside, pubescent outside, glabrous inside, margin ciliate; with one basal colletor at each sinus, colleters c. 0.2 \(\times\) 0.2 mm. \textit{Corolla} rotate to shallowly bowl-shaped, deeply divided; tube 3.6–5.9 mm long, glabrous outside; lobes 5, contorted to the right, triangular, 10.2–12.6 \(\times\) 5.3–6.4 mm, greenish white outside, whitish green or yellowish flushed purple inside, ciliate. \textit{Corona} staminal 5.5–7 mm in diam., 3.3–3.4 mm tall, slightly stipitate; stipe 1.16–1.66 mm tall; corona lobes fleshy, adnate to stamens, ovoid to sub-globose, slightly flattened above, 1.66–1.79 \(\times\) 1.39–1.79 mm, white to cream, outer process obtuse, inner process narrowing to an acute tooth incumbent to anthers. \textit{Anthers} with membranous apical appendages. \textit{Pollinia} erect, oblong, oblanceolate to clavate, 0.58–0.76 \(\times\) 0.12–0.21 mm, without pellucid margin; corpusculum rectangular, 0.24–0.28 \(\times\) 0.16–0.19 mm; caudicle 0.19–0.21 \(\times\) 0.04–0.05 mm. \textit{Ovary} conical, c. 0.7 \(\times\) c. 0.33 mm, glabrous. \textit{Fruit} and \textit{seeds} not seen.

**Etymology:**—The specific epithet refers to the type locality, Tay Nguyen area in Vietnam.

**Phenology:**—Flowering specimens were collected in June.

**Conservation status:**—Data Deficient (DD; IUCN 2017). \textit{Dregea taynguyenensis} is known only from the type locality and from two nearby locations all within Kon Ka Kinh National Park. A comprehensive botanical survey of the park has not been carried out to date. Even if we estimate the AOO as the entire Kon Ka Kinh National Park (AOO < 500 km\(^2\)), a provisional conservation status cannot be assessed, as we have no information on the number of population, their potential decline or fluctuation.

**Observations:**—The five species of \textit{Dregea} found in Vietnam and neighbouring countries are clearly distinguishable from each other based on morphological characters (Table 1). In sterile state \textit{D. taynguyenensis} can only be confused with \textit{D. cuneifolia} because both taxa have elliptic-oblong leaf blades, cuneate at base and acuminate at apex; while \textit{D. sinensis}, \textit{D. volubilis} and \textit{D. yunnanensis} have ovate-cordate to suborbicular leaf blades (lanceolate in \textit{D. volubilis} var. \textit{angustifolia} J.D. Hooker (1883: 47)). The flowers of \textit{D. taynguyenensis} are characterized by deeply divided corollas and lobes 10.2–12.6 \(\times\) 5.3–6.4 mm, which are larger than those of the other three species. The species with the second largest corolla lobes is \textit{D. volubilis}, (6–8 \(\times\) 5–6 mm). Lastly, the calyx lobes of \textit{D. taynguyenensis} are comparable in size with those of \textit{D. volubilis}, however \textit{D. taynguyenensis} has lanceolate to linear calyx lobes, while \textit{D. volubilis} has ovate to oblong calyx lobes.

**Additional specimens examined:**

\textit{D. taynguyenensis}: VIETNAM. Tay Nguyen: Gia Lai province, Kon Ka Kinh National Park, 7 June 2011, \(T.B.\) Tran, \(V.H.\) Do & \(H.Q.\) Bui Bach0706201101 (HN); Ibid, 8 June 2011, \(T.B.\) Tran, \(V.H.\) Do & \(H.Q.\) Bui Bach0806201101 (HN).

\textit{D. cuneifolia}: VIETNAM. Lam Dong: Da Lat, 12 April 1984, \(T.D.\) Ly LX-VN 1470 (HM).

\textit{D. volubilis}: VIETNAM. Ninh Binh, s.d., \textit{VT. Chinh} s.n. (HN); Nghe An, s.d., \textit{Ngo Duc Phuong} 428 (HNU); Ninh Thuan, s.d., \textit{T.D. Ly} s.n. (HN); s.l., s.d. \textit{Q.B. Nguyen}, \textit{QB} 286 (HN); Ho Chi Minh, s.d., \textit{L. Pierre} 3522 (HM).

Acknowledgments

We thank the directors and curators of the HN, HNU, HNPM, IBK, K, KUN, KYO, P, SING, TI, TO, TUT, and VNM herbaria for loans of specimens and access to the material studied; Le Kim Chi for preparing the drawing. Funding for this research was provided by NAFOSTED (Grant No. 106.03-2017.08) and by the project “Bioprospecting on Biological Materials of Vietnam” (TTB). The National Parks Board Singapore sponsored numerous herbarium study
trips to Asian and European institutions to MR. Finally, we wish to express our gratitude to the anonymous reviewers and the Associate Editor for their useful comments and valuable corrections.
